

Identified issues in Nightli

The app is restricted to nightlife venues in Sweden, excluding users from nearby countries like Norway. This significantly limits its appeal and usability for a broader audience. Similar apps often face challenges in scaling geographically, as expanding to new regions requires working together with other clubs or companies for localized content, which can be time – demanding and resource – intensive.

Not including beer and shot pricing in the app negatively impacts bars and nightclubs by reducing transparency and making it harder for customers to plan their night. It can deter budget-conscious users, who may opt for bars and nightclubs with more transparent pricing. Additionally, it limits the bars and clubs' ability to promote special deals or attract customers looking for affordable drink options. This could result in lower foot traffic and missed revenue opportunities.

Nightli doesn't clarify whether being on the guestlist exempts users from entrance fees or provides details on age restrictions. This could lead to confusion and failed expectations, a common issue in apps that aim to streamline event entry but fail to communicate terms clearly.

The absence of a desktop or web version restricts access to users who prefer non-mobile platforms. This limitation is significant as other apps in the nightlife or event management domain. Like Eventbrite that offers multi – platform access for convenience and broader reach.

Description of the design process

Our design process was structured and collaborative, ensuring that each team member could contribute efficiently to the development of the prototype. The way we did that was with these steps: discovering requirements, designing alternatives, prototyping and evaluating. (Preece, Rogers and Sharp, p.52). First, we began discussing the core functionalities and goals of the Nightli app. This stage focused on identifying the primary user needs, such as finding nightlife events, using the guestlist, and product pricing. Then two of the team

members responsible for designing the initial prototype. This included creating wireframes and mockups for the user interface, making sure that the app's navigation and key features were clearly represented. Lastly, after the prototypes was developed, it was shared with the last group member for review. Here we came with new ideas and design flaws and discussed which to keep and which to let go. Our three focus areas were user experience, visual design and feature functionality. This was to get an app that was easy to navigate, had a good layout with color scheme in and overall aesthetic appeal so when we implemented new features, such as product pricing this would look good, and the app would be pleasant to use and look at. When we had completed our prototyping, we evaluated the designs by giving each other feedback, and getting feedback from a presentation we did. We then made further improvements and ended up with the prototypes in this text.

Prototypes

Login screen and “my page”

Figure 1

Figure 2

Figure 1 is a prototype of the login screen on the app. In the original app the only option for login was with a phone number. We have added the options to login with phone number, email, X or Facebook for easier registration. Figure 2 is a prototype of a “my page” screen. The way you navigate to this is by clicking on your profile in the top left corner as illustrated on the next prototype figures. My page didn't exist in the original app, so we thought this would be a nice addition to the app to help with easy access to configure the app.

Search page

Figure 3

Figure 4

Figure 5

The difference between Figure 3 and Figures 4 and 5 is quite striking. In the original search page, the darker colors and less intuitive design made it difficult to navigate, especially for intoxicated users. Additionally, we've made the search page more personalized by prompting users with a question about where they want to go out.

Detail card and reviews

Figure 6

Figure 7

Figure 8

Figure 9

Figures 6 and 7 illustrate how we've refined the design to make it more tailored to individual bars. The updated layout emphasizes key information about the venue, ensuring users can easily access details that matter most. We've also introduced dedicated tabs for directions and reviews, providing a more streamlined and user-friendly experience. This redesign enhances usability by focusing on practical features that help users make informed decisions quickly and efficiently.

Figures 8 and 9 showcase the revamped review system. Based on feedback, we found that the original system felt clunky, and the lack of text made it difficult for users to get an accurate sense of the venue's atmosphere. While we appreciated the use of slides, we opted to simplify the design for a more streamlined and user-friendly experience.

Menus

Figure 10

Menus for bars and nightclubs were non-existent, so we made a prototype for this.

Improvements to the map

Figure 11

Figure 12

Figure 13

The original app provides a basic filter menu with category options such as "Favourites," "Restaurant," "Concert," "Nightclub," "Outdoor," and "Bar." (Figure 11). While functional, the filtering options are limited and do not address the needs of users who prioritize specific features like price or entrance fees. Figure 12 introduces a new sorting feature, allowing users to organize venues by specific criteria like "Cheapest Beer." The prototype highlights the most affordable option: "Old Irish is cheapest now in town!" with a clear visual marker. We also added a call-to-action button, making it easy for users to get directions directly to the selected venue, as the app already uses Google maps as their map provider

Figure 13 expands on the sorting options by including multiple criteria, such as "Cheapest Beer" and "Cheapest Entrance." This allows users to customize their search based on what matters most to them, providing a more user-focused experience. The map view dynamically

updates according to the selected sorting option, helping users quickly locate venues that match their preferences.
